

Holding content

To get your Quarto webpage to show up with the url

`yourname.github.io/yourrepo`

you have a few steps.

Turn on GitHub Pages for your repo

- Turn on GitHub Pages under Settings > Pages . You will set pages to be made from the `gh-pages` branch and the root directory.
- Turn on GitHub Actions under Settings > Actions > General

The GitHub Action will automatically recreate your website when you push to GitHub **after** you do the initial `gh-pages` set-up

Do your first publish to `gh-pages`

The first time you publish to `gh-pages`, you need to do so locally.

- On your local computer, open a terminal window and `cd` to your repo directory. Here is what that `cd` command looks like for me. Your command will look different because your local repo will be somewhere else on your computer.

```
cd ~/Documents/GitHub/NOAA-quarto-simple
```

- Publish to the `gh-pages`. In the terminal type

```
quarto publish gh-pages
```

This is going to render your webpage and then push the `_site` contents to the `gh-pages` branch.

Don't like using `gh-pages`?

In some cases, you don't want your website on the `gh-pages` branch. For example, if you are creating releases and you want the website pages archived in that release, then you won't want your website pages on the `gh-pages` branch.

Here are the changes you need to make if you to avoid `gh-pages` branch.

- At the top of `_quarto.yml` add the following:

```
project:
  type: website
  output-dir: docs
```

- On GitHub under Settings > Pages set pages to be made from the `main` branch and the `docs` directory.
- Make sure `docs` is not listed in `.gitignore`
- Publish the site the first time locally using `quarto publish` from the terminal
- Change the GitHub Action because you can't use `quarto publish gh-pages`. You'll need to push to the main branch yourself (in the GitHub Action)

on: push: branches: main

name: Render and Publish

```
jobs: build-deploy: runs-on: ubuntu-latest env: GITHUB_PAT: ${ secrets.GITHUB_TOKEN
}}
```

steps:

- name: Check out repository
 - uses: actions/checkout@v2
- name: Set up R (needed for Rmd)
 - uses: r-lib/actions/setup-r@v2
- name: Install packages (needed for Rmd)
 - run: Rscript -e 'install.packages(c("rmarkdown", "knitr", "jsonlite"))'
- name: Set up Quarto
 - uses: quarto-dev/quarto-actions/setup@v2
 - with:
 - # To install LaTeX to build PDF book
 - # tinytex: true
 - # uncomment below and fill to pin a version
 - # version: 0.9.600
- name: Render Quarto Project
 - uses: quarto-dev/quarto-actions/render@v2
 - with:
 - to: html
- name: Set up Git
 - run: |
 - git config --local user.email "actions@github.com"
 - git config --local user.name "GitHub Actions"
- name: Commit all changes and push
 - run: |
 - git add -A && git commit -m 'Build site' || echo "No changes to commit"
 - git push origin || echo "No changes to commit"
